EXPERIENCE

Dow Jones

July 2025 – Present

Data Analyst

Princeton, NJ

- Automated the end-to-end **VOC detail-classification workflow** using **text embeddings** and **retrieval-augmented generation (RAG)**, eliminating manual processing by **30+ hours per week**.
- Built a **VOC Snowflake agent** for stakeholders to query data in natural language, improving self-service access to business data.
- Developed an automated **dbt** save-tracker pipeline, reducing daily manual effort by **80%**, saving **10+ hours per week**, and increasing reporting accuracy.
- Led the **AWS-to-Snowflake** migration by designing dbt models and transformation workflows that standardized data pipelines, improved query performance, and increased reliability for downstream reporting.

PROJECTS

OpenCode | TypeScript

January 2026 – March 2026

- Contributed to OpenCode, an open source AI coding agent with **14M+ monthly active users**, **23M+ downloads**, and **183K+ GitHub stars**.
- Improved TUI usability across provider connection, help, status, and dialog workflows by adding connected-provider indicators, version visibility, clickable escape controls, and hover states.
- Fixed the tui/open-help route so the endpoint correctly opens, instead of returning a success state without triggering an action.

blippy | Rust

February 2026 – March 2026

- Rust TUI with **20+ GitHub stars** that consolidates GitHub issue and pull request workflows into a keyboard-first terminal experience.
- Implemented a **full PR review system** on top of GitHub REST + GraphQL APIs, including split/expanded diff views, inline comments, review-thread resolution, and file-viewed tracking.
- Designed a local SQLite caching/sync pipeline for repo discovery, issue/comment indexing, and incremental refresh to keep navigation fast.

ourPLCC | Python, Java, Docker

January 2024 – June 2025

- Collaborated on ourPLCC, a programming languages compiler **used by professors across multiple universities** to teach programming language concepts to **thousands of students**.
- Implemented **LL(1) grammar** validation using FIRST and FOLLOW set algorithms, enabling automated conflict detection.
- Built a custom implementation of **Paull's algorithm** with bookkeeping and error tracing to eliminate left recursion in grammars

Bear Necessities Market | JavaScript, Docker, RabbitMQ, MongoDB

January 2025 – June 2025

- Developed the reporting system for BNM, open source food-pantry software built as part of an **NSF (National Science Foundation)** funded initiative spanning **5 academic institutions**.
- Built a microservice-based system with RESTful APIs and data pipelines to aggregate anonymous visit and inventory data for usage reporting.
- Integrated RabbitMQ for asynchronous, real-time data synchronization across microservices.

EDUCATION

Western New England University

August 2021 – May 2025

Bachelor of Science in Computer Science | GPA: 3.99

Springfield, MA

TECHNICAL SKILLS

Languages: Python, Java, JavaScript, TypeScript, Go, Rust, Swift, HTML, CSS, SQL

Frameworks & Libraries: React, Vue, Pandas, Matplotlib, Flask, RabbitMQ, MongoDB, dbt, ratatui

Tools, Data & Visualization: Git, Docker, AWS, BigQuery, Snowflake, GCP (Vertex AI), Adobe Experience Manager (AEM), Looker Studio, Power BI, Tableau
